Roland

TR-1000 VERSION 1.20 UPDATE

More Control. More Character. More TR-1000.

Forward Motion

Building on the impact of its October 2025 arrival, the TR-1000 gains powerful additions with the free Version 1.20 update. With everything from new instruments and effects to deeper tools for sonic exploration, this update provides users with a fresh dose of creative inspiration.

Precision Meets Character

The ultimate rhythm machine just got even better. Version 1.20 introduces dynamic effects to add color and crunch to mixes, plus a leveled-up LFO section for detailed sound design. You also get melodic bass instruments built from classic Roland bass drum tones, increased panning and effects control, and enhanced options for audio output levels and external MIDI operation.

Four New MFX

The TR-1000 now includes the revered **Vinyl Sims from the SP-303 and SP-404**, offering unique compression flavors, lo-fi color, wow and flutter, and vinyl crackle.

Cassette Sim lets users dial in a range of tape tones, with control over hiss level, drive, and tape age.

DJFX Delay takes a classic SP effect to another level, adding delay for hands-on stutters, glitches, and sweeps that trail off after disengaging.

Locked-In LFOs

The TR-1000 already included numerous modulation options, like LFOs, envelopes, and motion recording.

For additional rhythmic movement, Version 1.20 update features **upgraded track and kit LFOs** with trigger modes that reset with sequencer steps, creating complex envelope-like behaviors.

In addition, a sample-and-hold function makes it easy to craft evolving, stepped movements.

New Bass Lines with Legendary Sound

Built on detailed ACB (Analog Circuit Behavior) modeling from the 8X and 9X bass drums, new **808 and 909 Bass Line sound generators** are optimized for tuned bass duties.

With simple controls, default chromatic tuning for melodic sequencing, and extended decay times, these dynamic instruments will infuse your bass parts with soulful TR kick color.

Additional Updates

- Pan each layer independently on tracks 1-4.
- New MIDI mode for independent MIDI channel per track and external sample slice playback.
- Mute Trigger parameter in the 8X sound generators for crash cymbal, hand clap, and snare drum.
- IFX switch to quickly turn track FX on and off.
- New gain staging options to boost mix and USB audio outputs.
- More improvements and bug fixes.

Customers can now update their TR-1000 units to Version 1.20.

Please be sure to update your demo stock and product listings.
